

Project Title: Healthy and Economical Grocery Shopping Experience

Families today face rising food prices and increasing concerns about personal health. This project challenges students to design a multi-dimensional experience that empowers families to make healthy and economical grocery shopping choices. This experience will encompass both the pre-shopping phase (meal planning and home inventory management), the in-store shopping phase (navigating deals, making product comparisons, and considering nutritional information), and the post-shopping food preparation and consumption phase.

Objective:

Develop an accessible and engaging physical and digital experience that assists families in:

- Planning meals based on nutritional needs and budget constraints.
- Managing household food inventory to minimize waste.
- In-store shopping supports promotions, price comparisons, and nutritional values.
- Making informed and healthy food choices.
- Educating all family members, including children, about nutrition and smart shopping habits.

Target Audience:

- Families seeking to balance health and budget in their grocery shopping.
- Primary shoppers (parents/caregivers) and their children.
- Individuals with varying levels of digital literacy and accessibility needs

Success Criteria:

- User-centered design with a focus on accessibility.
- Innovation in integrating digital and physical experiences.
- Practicality and scalability of solutions.
- Engagement and educational value for all family members.

Final Thoughts:

Consider how your design can make grocery shopping a collaborative, educational, and enjoyable experience for families. Think about how technology can simplify healthy decision-making and how physical elements in the store can support this journey. Balance functionality with fun to create an impactful solution.
